

CodeScaler

Industrial Training Program 2026

Official Curriculum & Learning Roadmap

2 Months

Duration

2 Modules

Programs Offered

Certification

On Completion

Welcome to CodeScaler Industrial Training

CodeScaler's Industrial Training Program is meticulously designed to bridge the critical gap between academic learning and real-world industry demands. Over the course of 2 intensive months, you will work on hands-on projects, master cutting-edge technologies, and develop the professional skills that top companies seek in their hires.

We offer two specialized tracks, each crafted to take you from foundational concepts to industry-ready expertise. Every topic is taught with practical, job-focused examples — not just theory.

Program Highlights

Duration: 2 Months (8 Weeks) of Intensive, Hands-on Training

Mode: Online / Offline (Hybrid Available)

Certificate of Completion issued to all qualifying participants

Pre-Placement Offer (PPO) opportunity for top-performing students

Live projects, code reviews, and industry mentor sessions

Career guidance, resume building & interview preparation included

MODULE 01

Full Stack Web Development

HTML | CSS | JavaScript | React | Node | Express | MongoDB | Prisma | Git

Full Stack Web Development Track

The Full Stack Web Development track is your complete journey from writing your very first line of HTML to deploying full-fledged, production-ready web applications. You will gain mastery over both front-end and back-end technologies, understand how modern applications are architected, and build a portfolio of projects that demonstrate real-world proficiency.

By the end of this module, you will be capable of designing beautiful user interfaces, engineering robust server-side APIs, working with databases, managing code with Git, and deploying applications — skills that make you a complete, hireable full-stack developer.

Week-by-Week Learning Schedule

Week	Focus Area	Topics Covered
Week 1	Web Foundations	HTML5 semantics, forms, tables, media elements, accessibility; CSS3 selectors, box model, flexbox, grid, animations, responsive design
Week 2	JavaScript Core	ES6+ syntax, DOM manipulation, events, async/await, promises, fetch API, error handling, localStorage
Week 3	React.js	Components, JSX, props & state, hooks (useState, useEffect, useContext), React Router, conditional rendering, forms
Week 4	Git & Advanced React	Git workflow, branching strategies, GitHub, Redux/Context API, component libraries, performance optimization, deployment
Week 5	Node.js & Express	Node.js runtime, npm ecosystem, REST API design, Express routing, middleware, authentication (JWT), error handling
Week 6	MongoDB & Prisma	MongoDB CRUD, Mongoose ODM, schema design, aggregation pipelines, Prisma ORM, migrations, relational patterns

Week 7	Integration & Security	Full-stack integration, file uploads, email services, environment variables, security best practices, CORS, rate limiting
Week 8	Capstone Project	End-to-end project build, code review, deployment (Vercel/Render), portfolio presentation, mock interviews

Detailed Topic Breakdown

1. HTML5 — Building the Structure of the Web

A thorough grounding in HTML5 that goes well beyond basic tags. Students will learn how to write clean, semantic, and accessible markup that search engines and screen readers love.

- Document structure: DOCTYPE, head, body, meta tags, SEO best practices
- Semantic HTML5 elements: header, footer, nav, main, section, article, aside, figure
- Forms & validation: input types, labels, fieldset, form validation attributes
- Tables: thead, tbody, tfoot, colspan, rowspan, accessible captions
- Multimedia: audio, video, picture, source, canvas, SVG basics
- Hyperlinks, anchors, target attributes, mailto & tel links
- HTML accessibility (ARIA roles, alt attributes, tab index, keyboard navigation)
- Embedding external content: iframes, Google Maps, YouTube embeds

2. CSS3 — Crafting Beautiful, Responsive Interfaces

Students will learn to design visually stunning and fully responsive layouts using modern CSS techniques. Topics progress from basics to advanced layout systems and animations.

- CSS selectors: element, class, ID, attribute, pseudo-class, pseudo-element
- The box model: margin, border, padding, content, box-sizing
- Typography: Google Fonts, font properties, line-height, letter-spacing, text effects
- Colors & gradients: hex, RGB, HSL, linear-gradient, radial-gradient
- Flexbox: flex-direction, justify-content, align-items, flex-wrap, order, flex-grow
- CSS Grid: grid-template-columns/rows, areas, gap, auto-fit, minmax
- Responsive Design: media queries, mobile-first approach, viewport units (vw, vh, rem)
- CSS Transitions & Animations: keyframes, animation-timing-function, transform
- CSS Variables (Custom Properties) and theming
- Tailwind CSS basics: utility-first classes, configuration, dark mode

3. JavaScript (ES6+) — The Language of the Web

JavaScript is the backbone of modern web development. This module covers the language comprehensively, from syntax fundamentals to advanced asynchronous patterns used in production applications.

- Variables: var, let, const; scoping, hoisting, temporal dead zone
- Data types, type coercion, template literals, destructuring, spread/rest

- Functions: declarations, expressions, arrow functions, closures, higher-order functions
- Arrays: map, filter, reduce, find, some, every, flat, flatMap
- Objects: creation patterns, prototypes, classes, inheritance, Object methods
- DOM Manipulation: selecting elements, creating/modifying/removing nodes, events
- Event handling: event bubbling, delegation, custom events, form events
- Asynchronous JS: callbacks, Promises, async/await, Promise.all, error handling
- Fetch API: GET, POST, PUT, DELETE requests, handling JSON responses
- Browser APIs: localStorage, sessionStorage, Geolocation, Intersection Observer
- ES Modules: import/export, dynamic imports, module bundling concepts
- JavaScript debugging tools, Chrome DevTools, performance profiling

4. React.js — Building Modern Front-End Applications

React is the most widely-used UI library in the industry. This section covers everything from creating your first component to building a complete multi-page application with state management and routing.

- React philosophy: component-based architecture, virtual DOM, reconciliation
- JSX syntax: expressions, conditional rendering, lists and keys, fragments
- Functional components: props, prop types, default props, children
- State management with useState: controlled components, derived state
- Side effects with useEffect: dependencies array, cleanup, data fetching patterns
- useRef, useCallback, useMemo: performance optimization hooks
- Context API with useContext: avoiding prop drilling, global state
- React Router v6: BrowserRouter, Routes, Link, NavLink, useParams, useNavigate
- Forms in React: controlled vs uncontrolled, React Hook Form library
- Component patterns: compound components, render props, custom hooks
- API integration: loading states, error boundaries, suspense
- Introduction to state management libraries (Zustand / Redux Toolkit basics)
- UI Libraries: Material UI or Shadcn/UI component usage
- Deployment: building for production, deploying to Vercel or Netlify

5. Git & GitHub — Version Control Like a Professional

No developer works without Git. Students will learn Git from scratch and develop professional workflows used in real team environments.

- Git fundamentals: init, add, commit, status, log, diff
- Branching: create, switch, rename, delete branches
- Merging: fast-forward merge, three-way merge, resolving conflicts
- Rebasing: interactive rebase, squashing commits, rebase vs merge
- Remote repositories: push, pull, fetch, origin, upstream
- GitHub: creating repositories, pull requests, code reviews, issues, project boards
- Git workflows: Git Flow, trunk-based development, feature branch workflow
- GitHub Actions basics: automated testing and deployment pipelines
- Writing good commit messages and maintaining clean git history

6. Node.js — Server-Side JavaScript Runtime

Node.js brings JavaScript to the server. Students will understand how Node works under the hood and build powerful back-end services from scratch.

- Node.js architecture: event loop, call stack, libuv, non-blocking I/O
- Core modules: fs, path, os, http, events, stream, crypto
- npm ecosystem: package.json, scripts, devDependencies, versioning, npx
- Building a raw HTTP server without frameworks (to understand the foundation)
- Environment variables with dotenv, configuration management
- Error handling patterns: synchronous, asynchronous, unhandled rejections
- File system operations: reading/writing files, streams, piping
- Building CLI tools with Node.js

7. Express.js — Fast, Minimalist Web Framework

Express is the go-to framework for building REST APIs with Node.js. Students will build complete, secure, and well-structured APIs from the ground up.

- Express setup, routing basics: GET, POST, PUT, PATCH, DELETE
- Route parameters, query strings, request and response objects
- Middleware: built-in, third-party (morgan, cors, helmet), custom middleware
- REST API design principles: resource naming, status codes, versioning
- Authentication: user registration, login, JWT (JSON Web Tokens), refresh tokens
- Authorization: role-based access control (RBAC), protecting routes
- Input validation and sanitization: express-validator
- File uploads: handling multipart form data with Multer
- Sending emails with Nodemailer
- Error handling middleware, custom error classes, HTTP error responses
- API documentation with Swagger / Postman collections

8. MongoDB — NoSQL Database Mastery

MongoDB is the leading NoSQL database, ideal for flexible, scalable applications. Students will learn database design, querying, and best practices for real-world data models.

- MongoDB fundamentals: documents, collections, databases, BSON
- CRUD operations: insertOne, insertMany, find, updateOne, deleteOne
- Query operators: \$eq, \$ne, \$gt, \$lt, \$in, \$and, \$or, \$regex
- Update operators: \$set, \$unset, \$inc, \$push, \$pull, \$addToSet
- Mongoose ODM: schemas, models, validation, middleware (pre/post hooks)
- Schema design patterns: embedding vs referencing, one-to-many, many-to-many
- Population (virtual joins) with Mongoose .populate()
- Indexes: single field, compound, text, unique indexes, performance impact
- Aggregation pipeline: \$match, \$group, \$project, \$lookup, \$unwind, \$sort, \$limit
- Transactions: multi-document ACID transactions in MongoDB

- MongoDB Atlas: cloud setup, connection, monitoring, backups

9. Prisma ORM — Modern Database Toolkit

Prisma is a next-generation ORM that provides type-safe database access, intuitive data modeling, and powerful migration tooling for SQL databases.

- Introduction to ORMs and why Prisma stands out
- Prisma setup with PostgreSQL and MySQL
- Schema definition: models, field types, attributes, relations
- One-to-one, one-to-many, many-to-many relationships in Prisma schema
- Prisma Client: type-safe CRUD operations (create, findMany, update, delete)
- Advanced queries: filtering, sorting, pagination, nested writes
- Prisma Migrate: creating and running migrations, schema evolution
- Prisma Studio: visual database browser
- Transactions with Prisma: \$transaction API
- Seeding the database with realistic test data
- Combining Prisma with Express for a fully typed REST API

Hands-On Projects — Full Stack Track

Project 1: Personal Portfolio Website

Technologies: HTML5, CSS3, JavaScript, Git

Build a responsive, animated personal portfolio with project showcase, contact form, and GitHub integration. Deploy on GitHub Pages.

Project 2: E-Commerce Product Listing App

Technologies: React.js, React Router, Context API, Fetch API

A multi-page React app with product catalog, cart functionality, search/filter, and local storage persistence.

Project 3: RESTful Blog API

Technologies: Node.js, Express, MongoDB, Mongoose, JWT

A complete REST API with user authentication, CRUD for posts/comments, role-based access, file upload support, and full Postman documentation.

Project 4 (Capstone): Full Stack Task Management Application

Technologies: React, Node.js, Express, MongoDB/Prisma, JWT, Git, Deployment

A production-grade full stack application with user authentication, team workspaces, task boards (Kanban), real-time updates, email notifications, and full deployment to cloud. This

project will be featured in your professional portfolio.

MODULE 02

Data Analytics

MS Excel | Python | SQL | Git | Statistics | Power BI

Data Analytics Track

The Data Analytics track is a comprehensive, industry-aligned program that transforms students into confident data professionals. You will learn how to collect, clean, analyze, visualize, and communicate data insights that drive real business decisions.

From mastering Excel and SQL to writing Python scripts for large-scale data processing and building stunning Power BI dashboards, this track covers the complete modern data analyst toolkit. You will work with real-world datasets, develop statistical thinking, and build a portfolio that stands out to recruiters.

Week-by-Week Learning Schedule

Week	Focus Area	Topics Covered
Week 1	Excel Mastery	Advanced formulas, VLOOKUP/XLOOKUP, PivotTables, data validation, conditional formatting, charts, dashboards
Week 2	SQL Foundations	Database concepts, SELECT queries, WHERE/ORDER BY, JOINS (INNER/LEFT/RIGHT/FULL), GROUP BY, subqueries
Week 3	Advanced SQL & Git	Window functions, CTEs, stored procedures, views, indexes, query optimization, Git version control for analysts
Week 4	Python for Data	Python basics, NumPy arrays, Pandas DataFrames, data import/export, cleaning, filtering, grouping, merging
Week 5	Statistics & EDA	Descriptive statistics, distributions, hypothesis testing, correlation, regression, exploratory data analysis (EDA)
Week 6	Data Visualization	Matplotlib, Seaborn: charts, heatmaps, pair plots; storytelling with data, chart selection guidelines

Week 7	Power BI	Connecting data sources, data modeling, DAX measures, calculated columns, building interactive dashboards, publishing
Week 8	Capstone Project	End-to-end analytics project, data pipeline, insights report, Power BI dashboard, presentation to panel

Detailed Topic Breakdown

1. Microsoft Excel — The Analyst's First Weapon

Excel remains the most widely used tool in business analytics. Students will go far beyond basic spreadsheets to learn powerful data analysis and reporting features used by professional analysts daily.

- Spreadsheet fundamentals: workbooks, worksheets, cells, ranges, formatting
- Data entry best practices, data types, number formatting, date arithmetic
- Essential formulas: SUM, AVERAGE, COUNT, COUNTA, MIN, MAX, IF, IFS
- Lookup functions: VLOOKUP, HLOOKUP, XLOOKUP, INDEX-MATCH combinations
- Logical functions: AND, OR, NOT, IFERROR, nested IFs
- Text functions: CONCATENATE, LEFT, RIGHT, MID, TRIM, UPPER, LOWER, FIND, SUBSTITUTE
- Date & time functions: TODAY, NOW, DATEDIF, WEEKDAY, EOMONTH
- Statistical functions: STDEV, VAR, RANK, PERCENTILE, CORREL
- Conditional Formatting: color scales, data bars, icon sets, custom rules
- Data Validation: dropdown lists, date ranges, custom validation messages
- Sorting and Filtering: advanced filters, filter by color, custom sort orders
- PivotTables: creating, grouping, calculated fields, slicers, timelines
- PivotCharts: linked charts, drilldown, interactive reporting
- Charts: bar, line, pie, scatter, combo, sparklines — choosing the right chart
- Excel Dashboards: combining charts, PivotTables, slicers into a reporting dashboard
- Power Query: importing external data, transforming data, query editor
- What-If Analysis: Goal Seek, Data Tables, Scenario Manager

2. Python for Data Analysis

Python is the dominant language in data science and analytics. Students will build a strong Python foundation and master the most important data analysis libraries used in industry every single day.

- Python basics: variables, data types, lists, dictionaries, tuples, sets
- Control flow: if-else, for loops, while loops, list comprehensions
- Functions: defining, calling, lambda functions, *args, **kwargs
- File I/O: reading and writing CSV, JSON, Excel files with Python
- NumPy: arrays, array operations, broadcasting, indexing, statistical functions
- Pandas Series and DataFrames: creation, indexing, slicing (.loc, .iloc)
- Data loading: read_csv, read_excel, read_json, read_sql

- Data inspection: head, tail, info, describe, dtypes, shape, value_counts
- Handling missing data: isnull, dropna, fillna, interpolate
- Data cleaning: renaming columns, changing dtypes, removing duplicates, string operations
- Data transformation: apply, map, applymap, replace, bins/cut, get_dummies
- Filtering and selection: boolean indexing, query(), where()
- Aggregation: groupby, agg, pivot_table, crosstab
- Merging and joining: merge, join, concat, different join types
- Time series: datetime indexing, resampling, rolling window, shifting
- Exporting results: to_csv, to_excel, to_json

3. SQL — The Language of Data

Structured Query Language (SQL) is an essential skill for every data analyst. Students will go from basic SELECT queries to advanced analytics functions used in enterprise data warehouses.

- Database fundamentals: relational model, tables, rows, columns, keys
- SQL environments: MySQL, PostgreSQL, SQLite — setup and using GUI tools
- Basic queries: SELECT, FROM, WHERE, ORDER BY, LIMIT, DISTINCT
- Filtering: comparison operators, BETWEEN, IN, LIKE, IS NULL
- Aggregation: COUNT, SUM, AVG, MIN, MAX with GROUP BY, HAVING
- Joins: INNER JOIN, LEFT JOIN, RIGHT JOIN, FULL OUTER JOIN, CROSS JOIN, SELF JOIN
- Subqueries: scalar, correlated, subqueries in WHERE and FROM clauses
- Common Table Expressions (CTEs): WITH clause, recursive CTEs
- Window Functions: ROW_NUMBER, RANK, DENSE_RANK, LEAD, LAG, SUM OVER, AVG OVER, PARTITION BY
- String functions: CONCAT, SUBSTRING, UPPER, LOWER, TRIM, REPLACE, LENGTH
- Date functions: DATEPART, DATEADD, DATEDIFF, FORMAT, EXTRACT
- CASE WHEN expressions: conditional logic in queries
- Data manipulation: INSERT, UPDATE, DELETE, TRUNCATE
- DDL commands: CREATE TABLE, ALTER TABLE, DROP, constraints (PK, FK, UNIQUE, NOT NULL)
- Views: creating, updating, and using views for simplified reporting
- Stored Procedures and Functions: parameterized queries for reuse
- Indexes: clustered, non-clustered, performance implications
- Query optimization: EXPLAIN, query plans, avoiding N+1, indexing strategies
- SQL for analytics: calculating running totals, percentile ranks, cohort analysis

4. Git for Data Analysts

Version control is not just for developers — data analysts must also track changes to scripts, notebooks, and project files. Students will learn the essential Git workflow used in data teams.

- Why version control matters for data projects
- Git init, clone, add, commit, status, log, diff

- Branching: creating feature branches, switching branches
- Merging and resolving conflicts in Python scripts and Jupyter notebooks
- Remote repositories: push, pull, fork, pull requests on GitHub
- Best practices for .gitignore with Python and data projects (ignoring .env, large files)
- Using GitHub for project showcase and collaboration

5. Statistics for Data Analysis

Statistical thinking is the foundation of all data analysis. Students will develop the ability to describe data accurately, uncover patterns, test hypotheses, and make statistically sound inferences.

- Types of data: nominal, ordinal, interval, ratio; structured vs unstructured
- Measures of central tendency: mean, median, mode — when to use each
- Measures of dispersion: range, variance, standard deviation, IQR
- Data distributions: normal, skewed, bimodal; skewness and kurtosis
- Probability fundamentals: events, sample space, conditional probability, Bayes theorem
- Common distributions: Binomial, Poisson, Normal, Uniform
- Sampling techniques: random, stratified, cluster, systematic
- Confidence intervals: constructing and interpreting CIs for means and proportions
- Hypothesis testing: null vs alternative hypothesis, p-values, significance level
- t-test (one-sample, two-sample, paired), Chi-square test, ANOVA
- Correlation: Pearson and Spearman correlation, correlation vs causation
- Linear Regression: simple and multiple, R-squared, coefficients, residual analysis
- Exploratory Data Analysis (EDA): profiling, outlier detection, feature relationships

6. Data Visualization with Python

A data insight is only valuable if it can be communicated clearly. Students will learn to create compelling, publication-quality visualizations that tell data stories effectively.

- Matplotlib architecture: Figure, Axes, subplots, figure sizing and styling
- Line charts, bar charts, horizontal bars, stacked bars
- Histograms, density plots (KDE), box plots, violin plots
- Scatter plots, bubble charts, annotating plots
- Seaborn: built-in themes, statistical plots, relplot, catplot, displot
- Heatmaps: correlation matrices, confusion matrices
- Pair plots: exploring multivariate relationships
- Plotly basics: interactive charts, hover tooltips, Plotly Express
- Data visualization best practices: chart selection, color theory, accessibility
- Storytelling with data: structuring a visual narrative for stakeholders

7. Power BI — Business Intelligence Dashboards

Power BI is the industry-leading business intelligence platform used by thousands of organizations worldwide. Students will go from zero to building fully interactive, published dashboards.

- Power BI Desktop: installation, interface, workflow overview
- Connecting to data sources: Excel, CSV, SQL Server, web, APIs
- Power Query Editor in Power BI: data transformation, cleaning, column operations
- Data modeling: creating relationships between tables, star schema, snowflake schema
- DAX (Data Analysis Expressions): calculated columns vs measures
- Essential DAX functions: SUM, AVERAGE, COUNT, CALCULATE, FILTER, ALL, RELATED
- Time intelligence DAX: TOTALYTD, SAMEPERIODLASTYEAR, DATEADD
- Visualizations: bar chart, line chart, map, card, gauge, matrix, table, KPI
- Slicers and filters: visual-level, page-level, report-level filters
- Drillthrough and drill-down: navigating from summary to detail
- Bookmarks and navigation: creating button-based navigation
- Row-level security (RLS): restricting data access per user
- Power BI Service: publishing reports, creating workspaces, sharing dashboards
- Scheduled refresh: keeping dashboards updated automatically
- Mobile layout optimization for Power BI dashboards

Hands-On Projects — Data Analytics Track

Project 1: Sales Performance Dashboard in Excel

Technologies: Microsoft Excel, Power Query

Import and clean a multi-year sales dataset, build dynamic PivotTable reports, and create an interactive Excel dashboard with slicers showing revenue trends, regional performance, and product analysis.

Project 2: Retail Analytics with SQL

Technologies: MySQL / PostgreSQL, SQL

Work with a real e-commerce database to answer business questions: top products by revenue, customer lifetime value, monthly cohort retention, sales funnel drop-offs using advanced SQL queries and window functions.

Project 3: Exploratory Data Analysis in Python

Technologies: Python, Pandas, Matplotlib, Seaborn

Perform a full EDA on a public dataset (e.g., housing prices, customer churn, COVID trends). Clean data, engineer features, conduct statistical tests, and produce a comprehensive visual report.

Project 4 (Capstone): End-to-End Business Intelligence Report

Technologies: Python, SQL, Power BI, Git, Excel, Statistics

A complete analytics project from raw data ingestion to an executive Power BI dashboard. Includes data pipeline (Python + SQL), statistical analysis, stakeholder-ready visualizations, and a written insights report — ready to showcase to employers.

Program Details & Benefits

Certification & Recognition

Every student who successfully completes the program will receive an official Certificate of Completion from CodeScaler. The certificate is digitally verifiable and designed to be LinkedIn-ready for your professional profile.

Certificate Type Certificate of Industrial Training Completion	Issued By CodeScaler (Digitally Verifiable)
Eligibility Minimum 75% attendance & project submission	LinkedIn Integration Share digitally on your profile

Pre-Placement Offer (PPO) Opportunity

Stand Out. Get Rewarded.

Students who demonstrate exceptional performance during the training — through consistent effort, high-quality project work, technical skill, and professional conduct — will be evaluated for a Pre-Placement Offer (PPO). This is a direct opportunity to join the CodeScaler team or be recommended to our partner companies without going through a full recruitment cycle.

Top performers are evaluated based on: project quality, problem-solving ability, code/analysis quality, communication skills, and overall attitude during the program.

What You Will Walk Away With

- ✓ A strong, project-backed GitHub / portfolio profile
- ✓ A verifiable Certificate of Completion from CodeScaler
- ✓ Real-world project experience that goes on your resume
- ✓ Deep understanding of industry tools and workflows
- ✓ Connections with mentors and a peer network of fellow developers/analysts
- ✓ Interview preparation: mock interviews, resume review, LinkedIn optimization
- ✓ PPO eligibility for top 10% performers
- ✓ Lifetime access to session recordings and materials

Training Schedule & Logistics

Duration	2 Months (8 Weeks)
Sessions per Week	5 Days/Week (Weekday schedule)
Session Length	2 – 3 Hours per Day
Mode	Online (Live Sessions) / Offline / Hybrid
Mentorship	Weekly 1-on-1 doubt sessions and code/analysis reviews
Assessments	Weekly quizzes, mid-program evaluation, final project presentation
Certificate	Issued within 7 days of program completion
Batch Size	Limited seats — small cohorts for personalized attention

Eligibility & Prerequisites

Our program is designed to be inclusive and accessible. Whether you are a fresh graduate, a final-year student, or someone looking to transition into tech, you are welcome to apply.

- Open to B.Tech, BCA, MCA, B.Sc. (CS/IT), M.Sc. students and fresh graduates
- No prior industry experience required
- Basic computer literacy is sufficient for beginners
- Students with some programming background will get an additional boost
- A laptop/desktop with internet connectivity is required
- A commitment to attend sessions regularly and submit assignments on time

Pricing & Value — What You Get

Complete Program Fee

Rs. 4,999

One-Time Payment | No Hidden Charges
Per Module (Full Stack or Data Analytics)

Everything Included at Rs. 4,999

- ✓ 8 Weeks of Live, Expert-Led Sessions
- ✓ All Course Materials & Notes
- ✓ 4 Hands-On Real-World Projects
- ✓ Weekly Doubt & Mentorship Sessions
- ✓ Certificate of Completion
- ✓ Resume Review & LinkedIn Optimization
- ✓ Mock Interview Practice
- ✓ PPO Opportunity for Top Performers
- ✓ Lifetime Access to Recorded Sessions
- ✓ Career Guidance & Job Referrals

Why Rs. 4,999 Is a No-Brainer Investment

To put this in perspective — here is what the same quality of education would cost you elsewhere:

What You Are Getting	Market Price	At CodeScaler
Live Instructor-Led Bootcamp (8 Weeks)	Rs. 25,000 - Rs. 60,000	Included
4 Guided Real-World Projects with Reviews	Rs. 8,000 - Rs. 15,000	Included
Industry Certification (Verifiable)	Rs. 2,000 - Rs. 5,000	Included
1-on-1 Mentorship & Weekly Doubt Sessions	Rs. 5,000 - Rs. 10,000	Included
Resume Review & Career Coaching	Rs. 3,000 - Rs. 8,000	Included
Mock Interview Preparation	Rs. 2,000 - Rs. 5,000	Included
Lifetime Access to Session Recordings	Rs. 3,000 - Rs. 6,000	Included
PPO / Job Referral Opportunity	Priceless	Included
Total Market Value	Rs. 48,000 - Rs. 1,09,000	Rs. 4,999 Only

Less than Rs. 84 per day for 2 months of world-class training.

That is the cost of a cup of chai — for skills that can 10x your career earnings. We believe quality education should be affordable and accessible to every student in India. That is the CodeScaler promise.
